

# Task 1. Explore data with Wireshark

In this task, you must open a network packet capture file that contains data captured from a system that made web requests to a site. You need to open this data with Wireshark to get an overview of how the data is presented in the application.

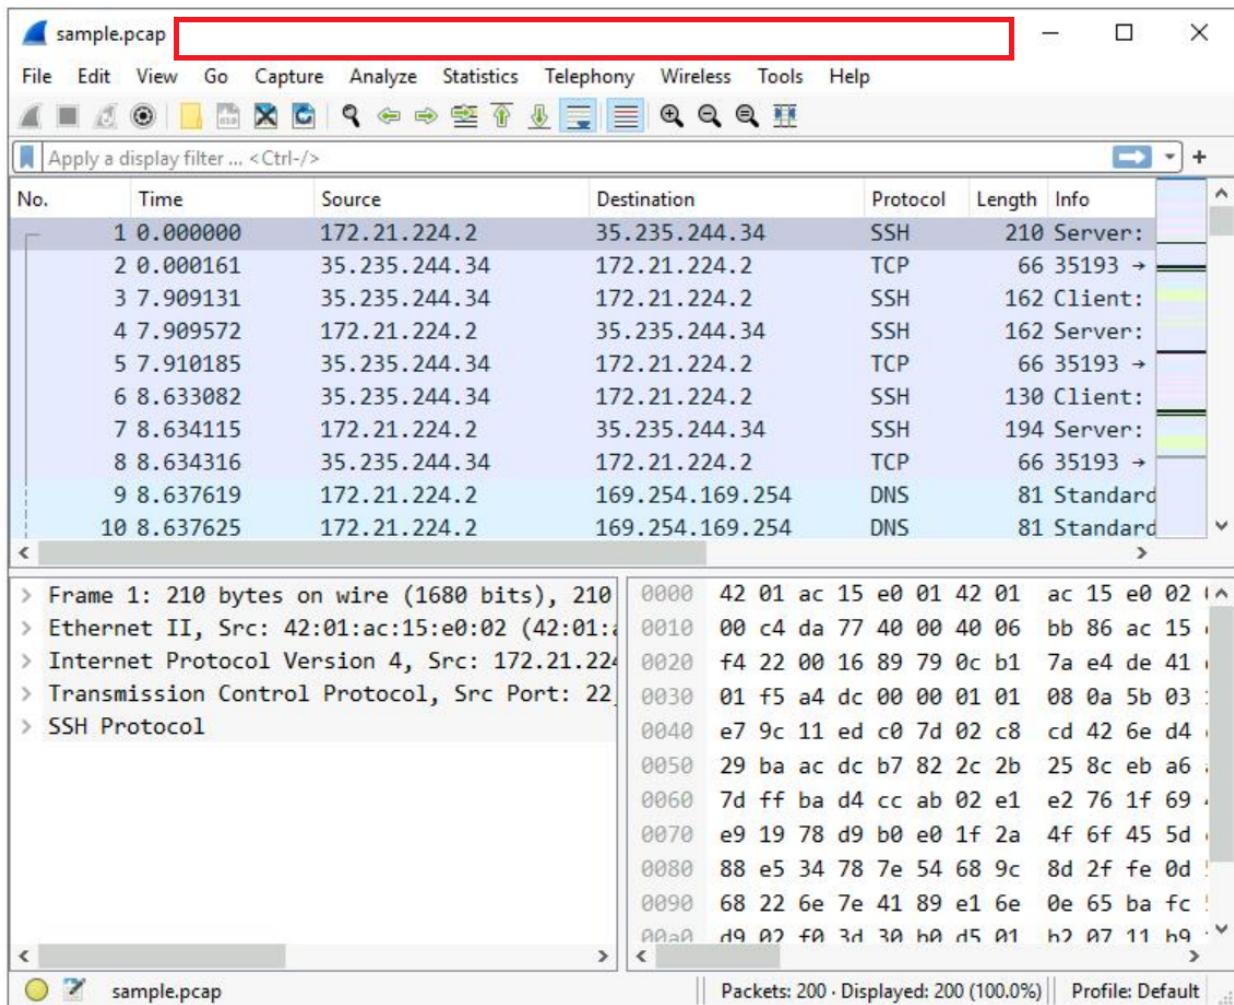

1. Open the packet capture file by double-clicking the file called **sample** on the Windows desktop. Wireshark starts.

The packet capture file has the Wireshark packet capture file icon, which shows a shark's fin swimming above three rows of binary digits. The packet capture file has a **.pcap** file extension that is hidden by default by Windows Explorer and on the desktop view.

**Note:** A **Software Update** dialog box may appear, notifying you that a new version of Wireshark is available. Click **Skip this version**.

- Double-click the Wireshark title bar next to the **sample.pcap** filename to maximize the Wireshark application window.

A lot of network packet traffic is listed, which is why you'll apply filters to find the information needed in an upcoming step.

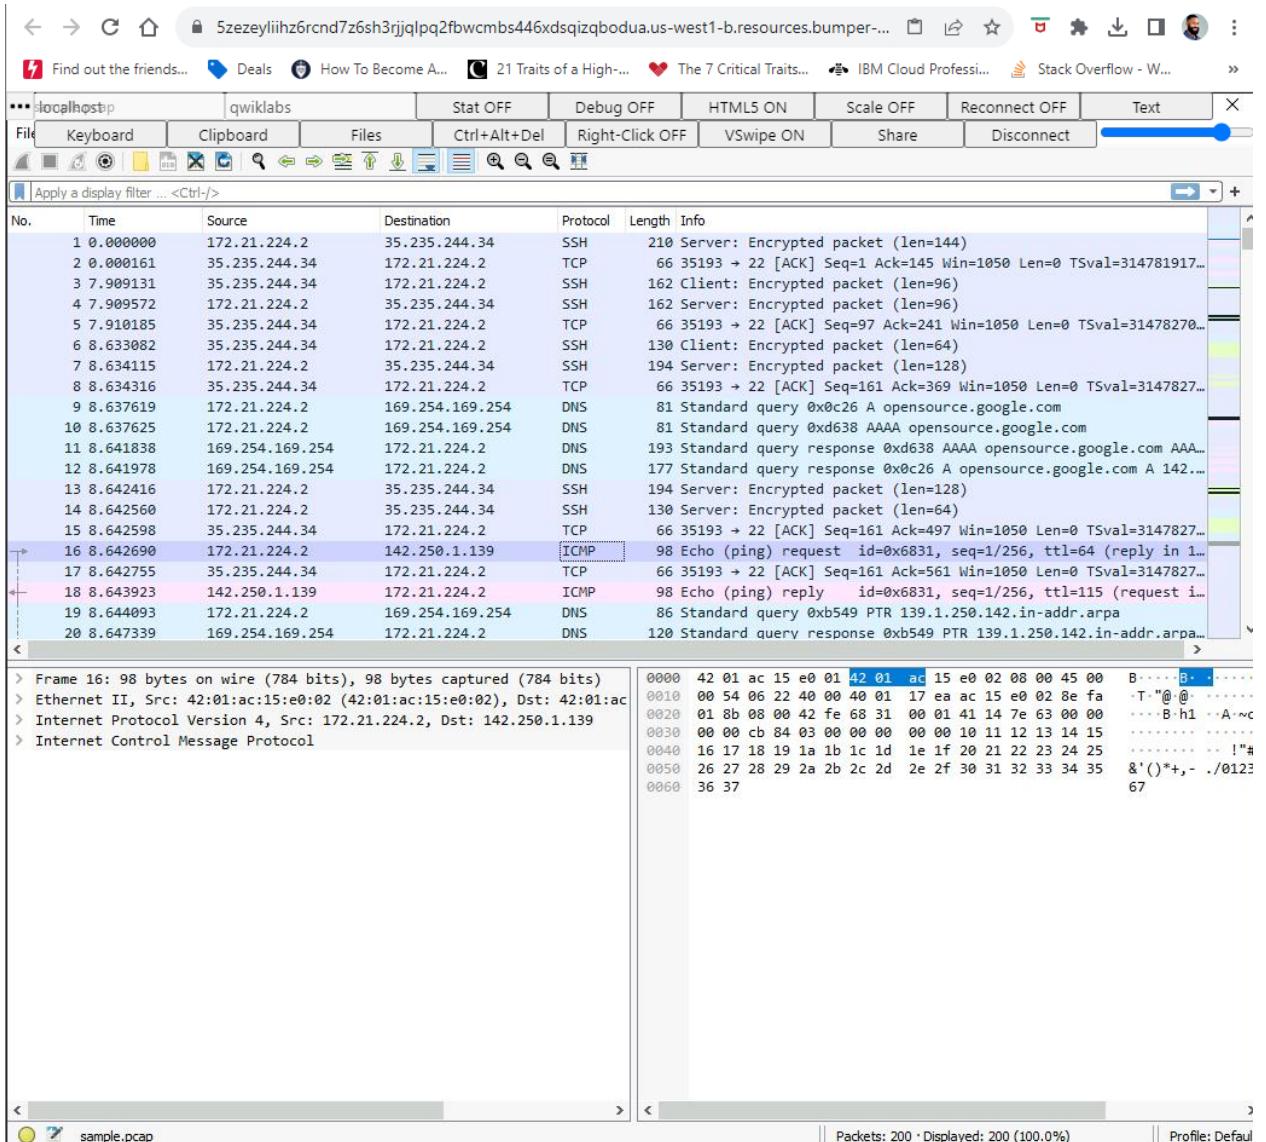

For now, here is an overview of the key property columns listed for each packet:

- No.**: The index number of the packet in this packet capture file
- Time**: The timestamp of the packet
- Source**: The source IP address

- **Destination:** The destination IP address
- **Protocol:** The protocol contained in the packet
- **Length:** The total length of the packet
- **Info:** Some information about the data in the packet (the payload) as interpreted by Wireshark

Not all the data packets are the same color. Coloring rules are used to provide high-level visual cues to help you quickly classify the different types of data. Since network packet capture files can contain large amounts of data, you can use coloring rules to quickly identify the data that is relevant to you. The example packet lists a group of light blue packets that all contain DNS traffic, followed by green packets that contain a mixture of TCP and HTTP protocol traffic.

3. Scroll down the packet list until a packet is listed where the info column starts with the words 'Echo (ping) request'.

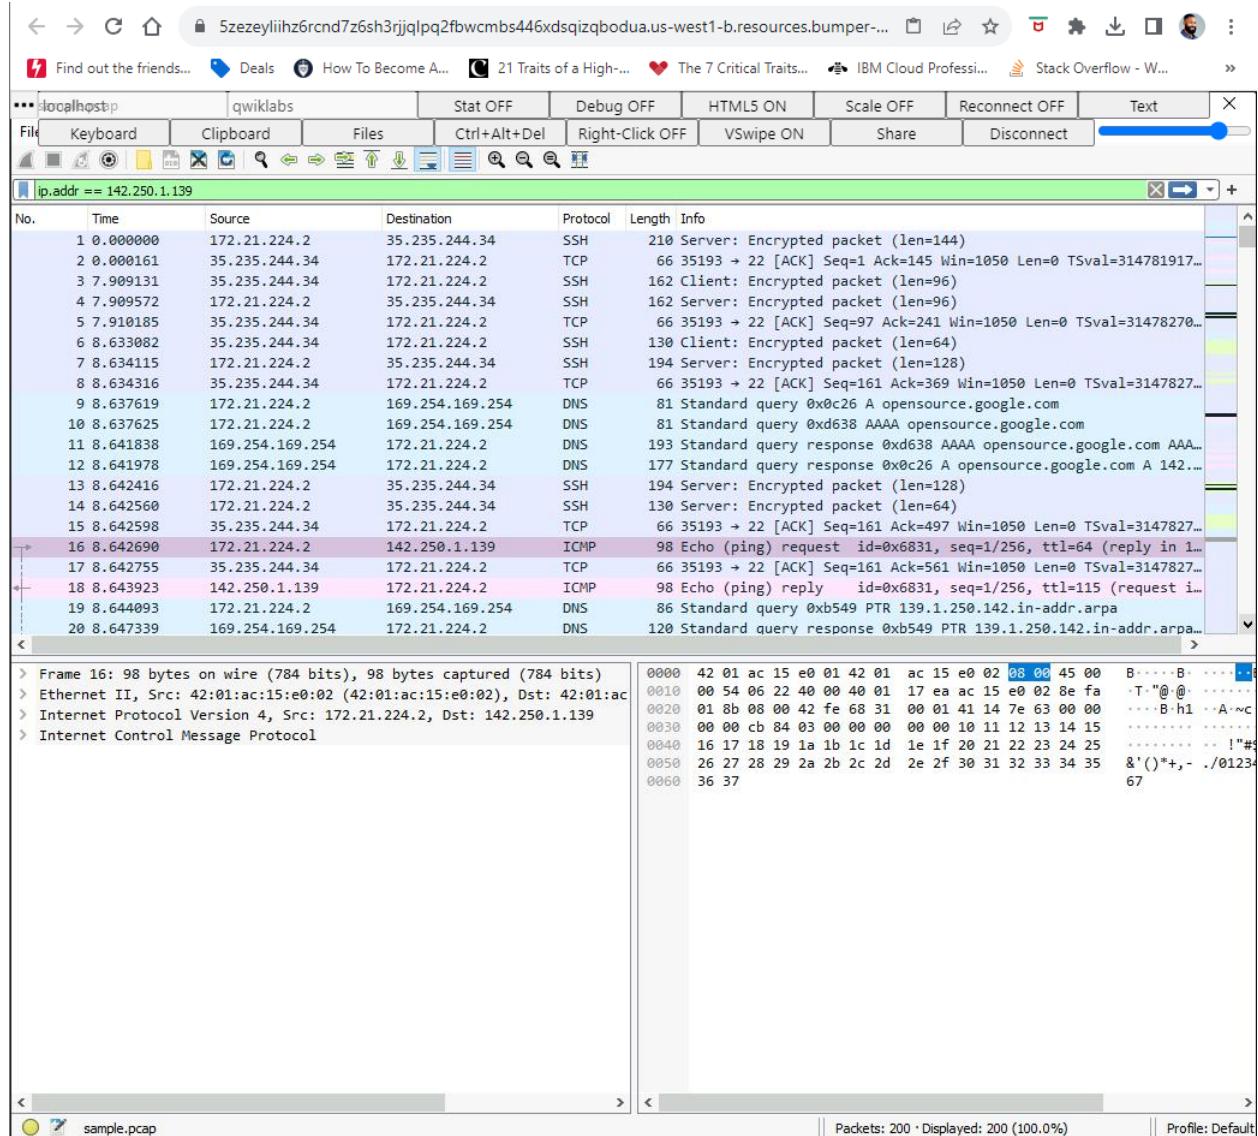

ICMP is the protocol type listed for the first (and all) packets that contain 'Echo (ping) request' in the info column.

## Task 2. Apply a basic Wireshark filter and inspect a packet

In this task, you'll open a packet in Wireshark for more detailed exploration and filter the data to inspect the network layers and protocols contained in the packet.

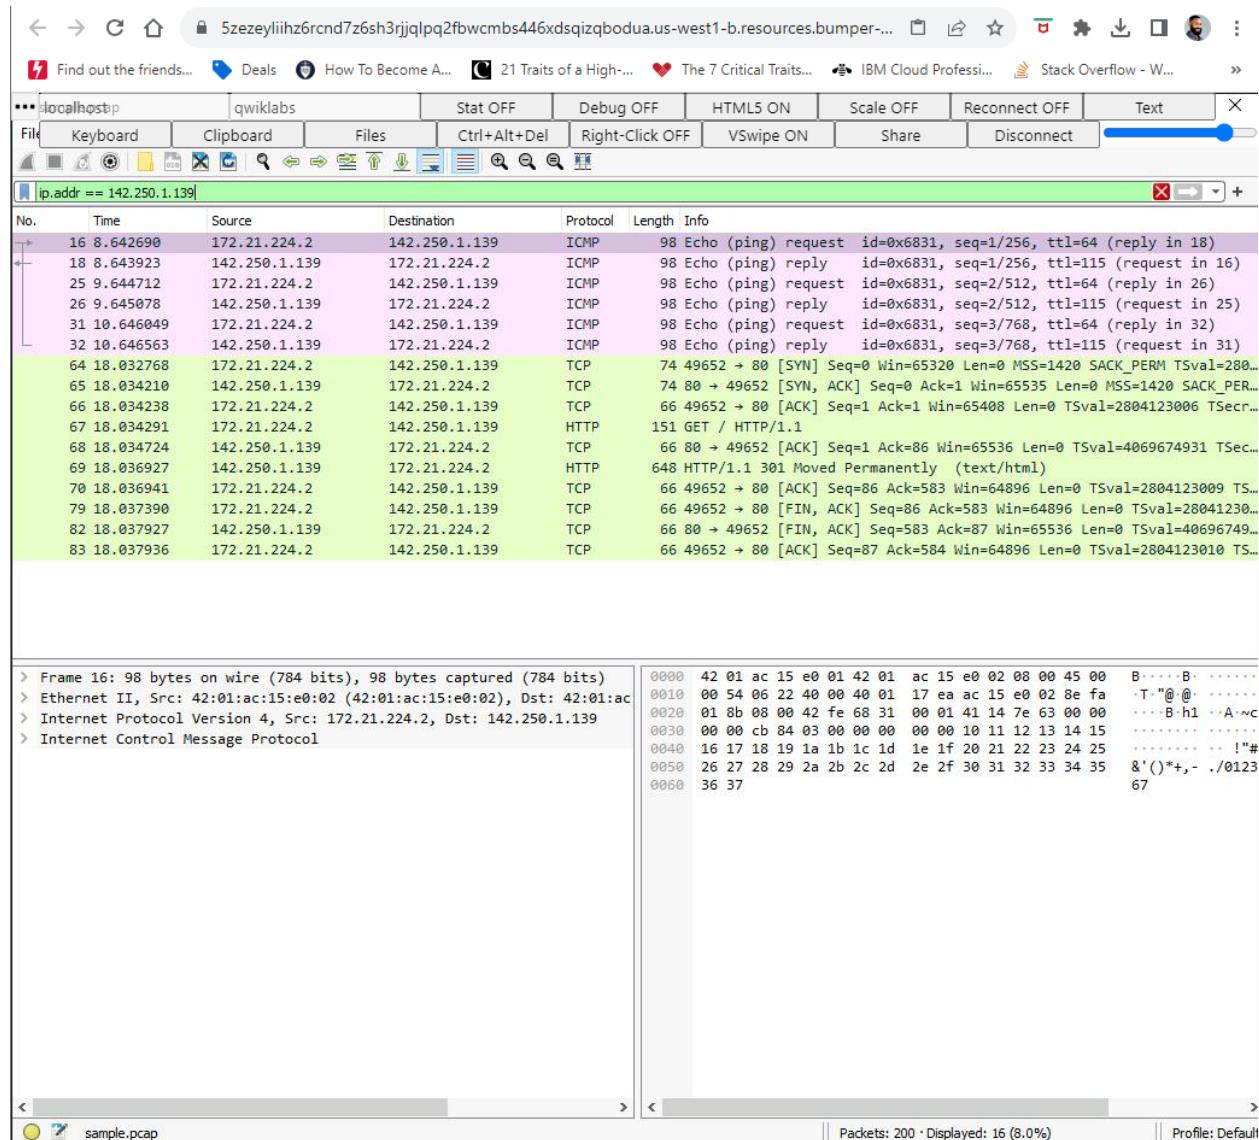

1. Enter the following filter for traffic associated with a specific IP address. Enter this into the **Apply a display filter...** text box immediately above the list of packets:

```
ip.addr == 142.250.1.139
```

2. Press **ENTER** or click the **Apply display filter** icon in the filter text box.

The list of packets displayed is now significantly reduced and contains only packets where either the source or the destination IP address matches the address you entered. Now only two packet colors are used: light pink for ICMP protocol packets and light green for TCP (and HTTP, which is a subset of TCP) packets.

### 3. Double-click the first packet that lists **TCP** as the protocol.

This opens a packet details pane window:

The screenshot shows the Wireshark details pane. The top section displays a tree view of the packet structure:

```
> Frame 64: 74 bytes on wire (592 bits), 74 bytes captured (592 bits)
> Ethernet II, Src: 42:01:ac:15:e0:02 (42:01:ac:15:e0:02), Dst: 42:01:ac:15:e0:01 (42:01:ac:15:e0:01)
> Internet Protocol Version 4, Src: 172.21.224.2, Dst: 142.250.1.139
> Transmission Control Protocol, Src Port: 49652, Dst Port: 80, Seq: 0, Len: 0
```

The bottom section shows the raw packet bytes in hexadecimal and ASCII format:

Hex	ASCII
0000 42 01 ac 15 e0 01 42 01	ac 15 e0 02 08 00 45 00
0010 00 3c e4 a8 40 00 40 06	39 76 ac 15 e0 02 8e fa
0020 01 8b c1 f4 00 50 cb 6b	93 a0 00 00 00 00 a0 02
0030 ff 28 1c cc 00 00 02 04	05 8c 04 02 08 0a a7 23
0040 85 7d 00 00 00 01 03 03 07	( ..... # ).....

Below the pane are two buttons: "Show packet bytes" (checked) and "Close".

The upper section of this window contains subtrees where Wireshark will provide you with an analysis of the various parts of the network packet. The lower section of the window contains the raw packet data displayed in hexadecimal and ASCII text. There is also placeholder text for fields where the character data does not apply, as indicated by the dot (".").

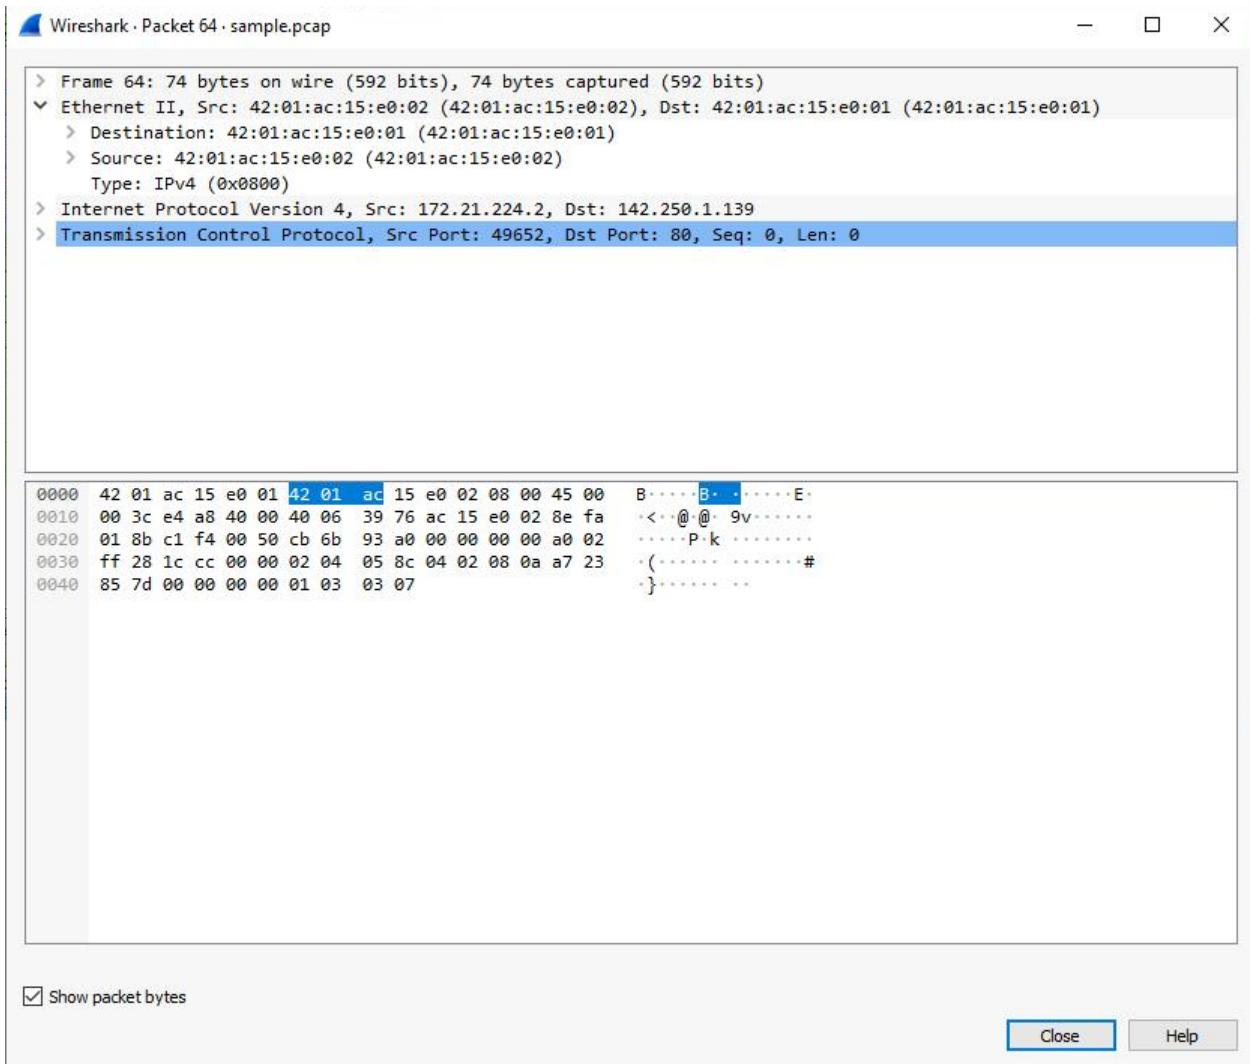

**Note:** The details pane is located at the bottom portion of the main Wireshark window. It can also be accessed in a new window by double clicking a packet.

- Double-click the first subtree in the upper section. This starts with the word **Frame**.

The screenshot shows the Wireshark interface with the title bar "Wireshark · Packet 64 · sample.pcap". The main window displays a single network frame (Frame 64) in both the "Summary" and "Details" panes. The "Details" pane is expanded, showing extensive information about the frame, including its arrival time (Nov 23, 2022 12:38:34.620693000 Greenwich Standard Time), epoch time (1669207114.620693000 seconds), and various protocol headers and options. Below the details, the "Hex" and "Text" panes show the raw byte sequence and ASCII representation of the packet. At the bottom left, there is a checked checkbox labeled "Show packet bytes". At the bottom right, there are "Close" and "Help" buttons.

This provides you with details about the overall network packet, or frame, including the frame length and the arrival time of the packet. At this level, you're viewing information about the entire packet of data.

- Double-click **Frame** again to collapse the subtree and then double-click the **Ethernet II** subtree.

This item contains details about the packet at the Ethernet level, including the source and destination MAC addresses and the type of internal protocol that the Ethernet packet contains.

6. Double-click **Ethernet II** again to collapse that subtree and then double-click the **Internet Protocol Version 4** subtree.

The screenshot shows the Wireshark interface with the title bar "Wireshark · Packet 64 · sample.pcap". The main window displays a detailed tree view of an IP packet's structure. The summary pane below shows the raw hex and ASCII data for the selected packet. A checkbox at the bottom left is checked, labeled "Show packet bytes". At the bottom right are "Close" and "Help" buttons.

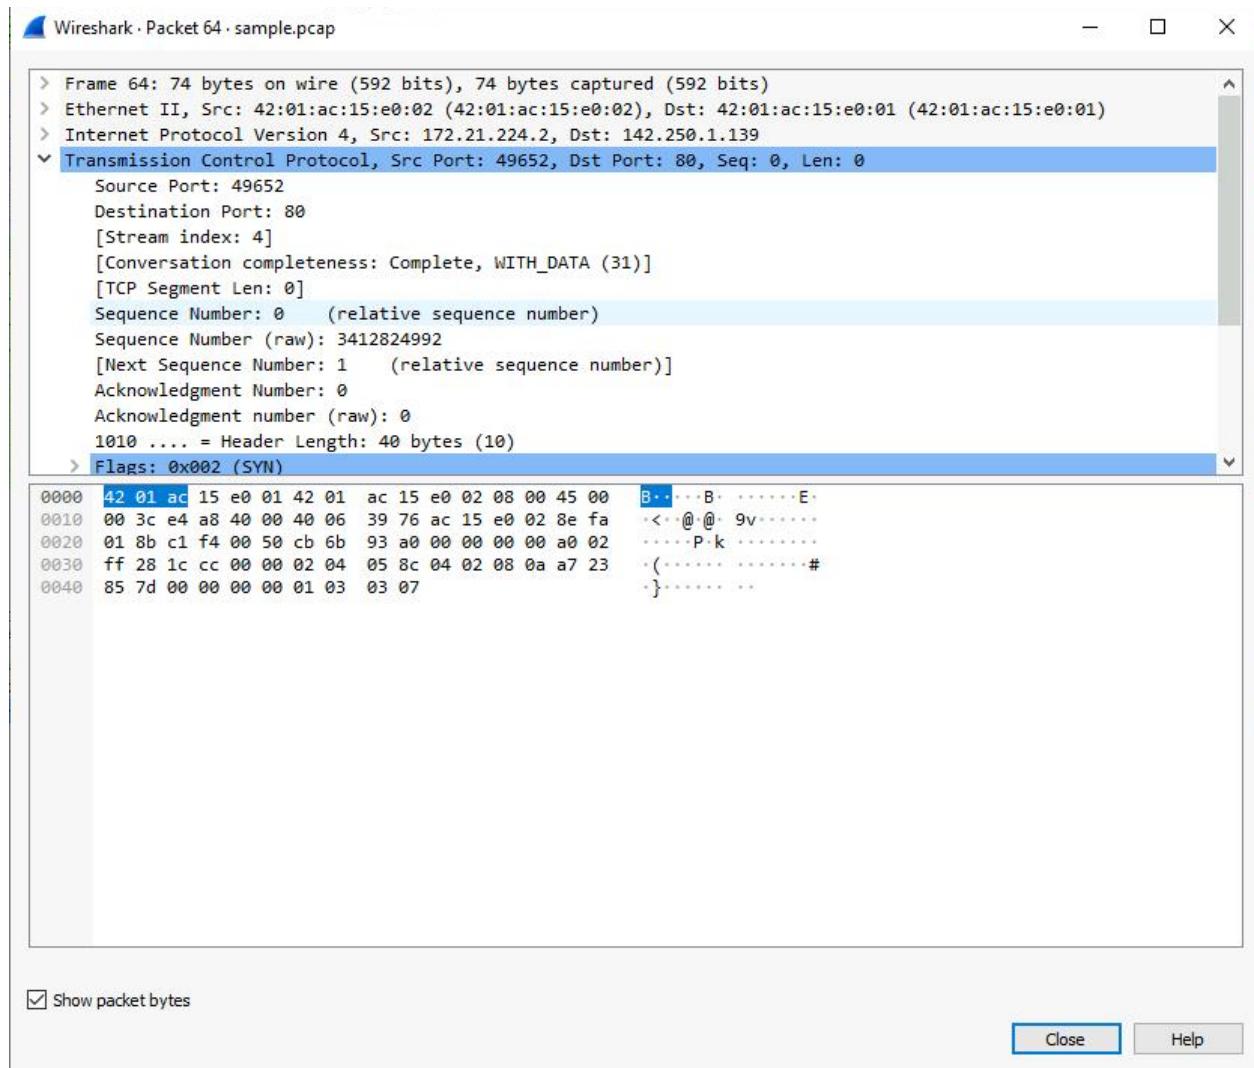

```
> Frame 64: 74 bytes on wire (592 bits), 74 bytes captured (592 bits)
> Ethernet II, Src: 42:01:ac:15:e0:02 (42:01:ac:15:e0:02), Dst: 42:01:ac:15:e0:01 (42:01:ac:15:e0:01)
└ Internet Protocol Version 4, Src: 172.21.224.2, Dst: 142.250.1.139
    0100 .... = Version: 4
    .... 0101 = Header Length: 20 bytes (5)
    > Differentiated Services Field: 0x00 (DSCP: CS0, ECN: Not-ECT)
        Total Length: 60
        Identification: 0xe4a8 (58536)
    > 010. .... = Flags: 0x2, Don't fragment
        ...0 0000 0000 0000 = Fragment Offset: 0
        Time to Live: 64
        Protocol: TCP (6)
        Header Checksum: 0x3976 [validation disabled]
        [Header checksum status: Unverified]
        Source Address: 172.21.224.2
        Destination Address: 142.250.1.139
0000  42 01 ac 15 e0 01 42 01  ac 15 e0 02 08 00 45 00  B.....B.....E.
0010  00 3c e4 a8 40 00 40 06  39 76 ac 15 e0 02 8e fa  <...@...9v.....
0020  01 8b c1 f4 00 50 cb 6b  93 a0 00 00 00 00 a0 02  .....P.k.....
0030  ff 28 1c cc 00 00 02 04  05 8c 04 02 08 0a a7 23  .(.....#.....
0040  85 7d 00 00 00 00 01 03  03 07  .....}.....
```

This provides packet data about the Internet Protocol (IP) data contained in the Ethernet packet. It contains information such as the source and destination IP addresses and the Internal Protocol (for example, TCP or UDP), which is carried inside the IP packet.

**Note:** The Internet Protocol Version 4 subtree is Internet Protocol Version 4 (IPv4). The third subtree label reflects the protocol.

The source and destination IP addresses shown here match the source and destination IP addresses in the summary display for this packet in the main Wireshark window.

7. Double-click **Internet Protocol Version 4** again to collapse that subtree and then double-click the **Transmission Control Protocol** subtree.

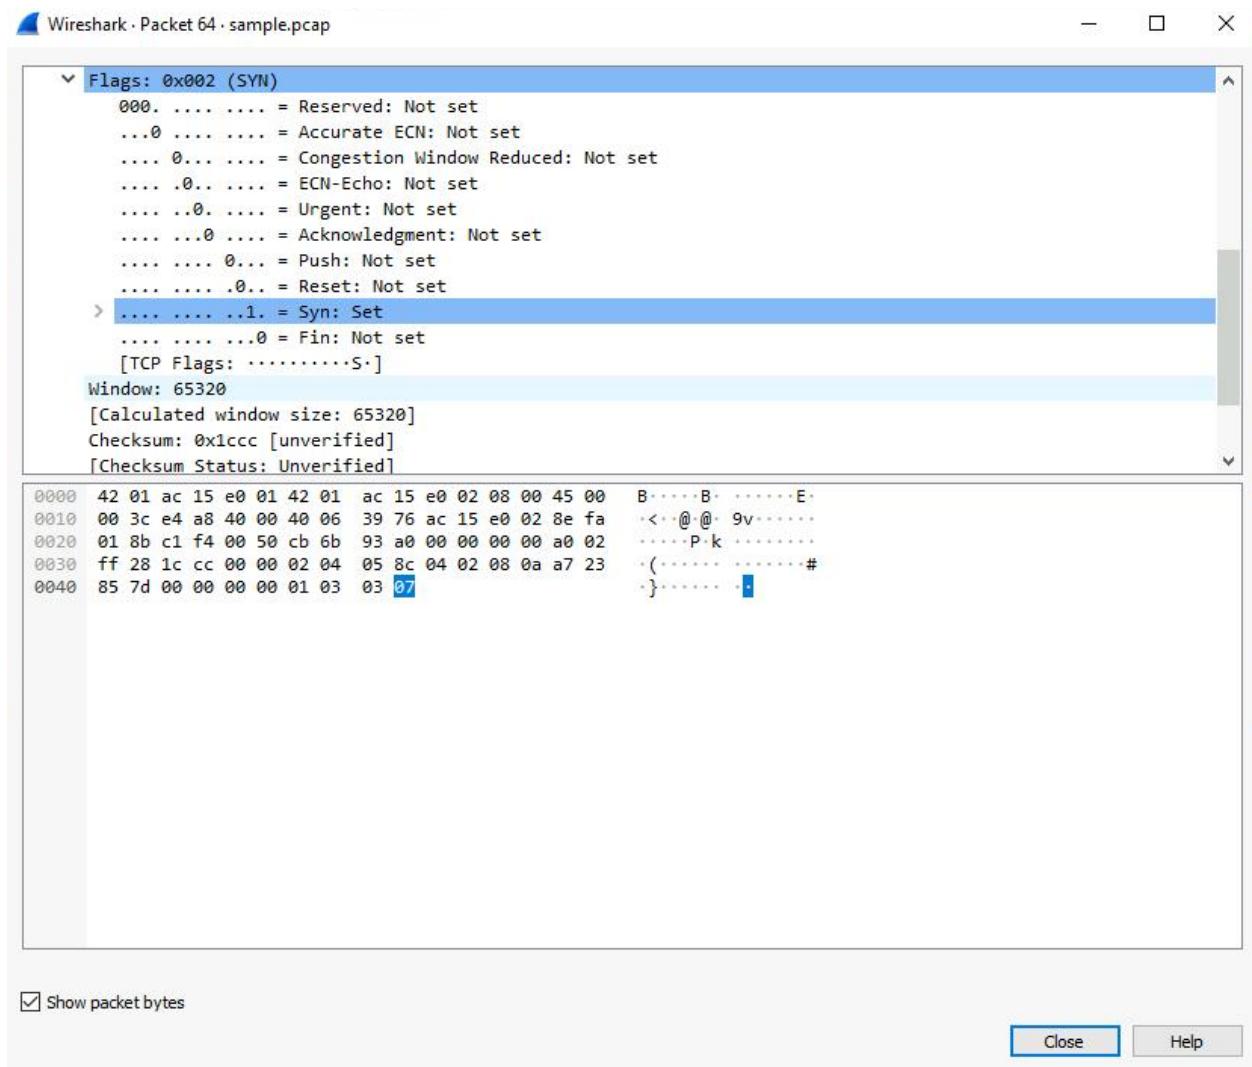

This provides detailed information about the TCP packet, including the source and destination TCP ports, the TCP sequence numbers, and the TCP flags.

The source port and destination port listed here match the source and destination ports in the info column of the summary display for this packet in the list of all of the packets in the main Wireshark window.

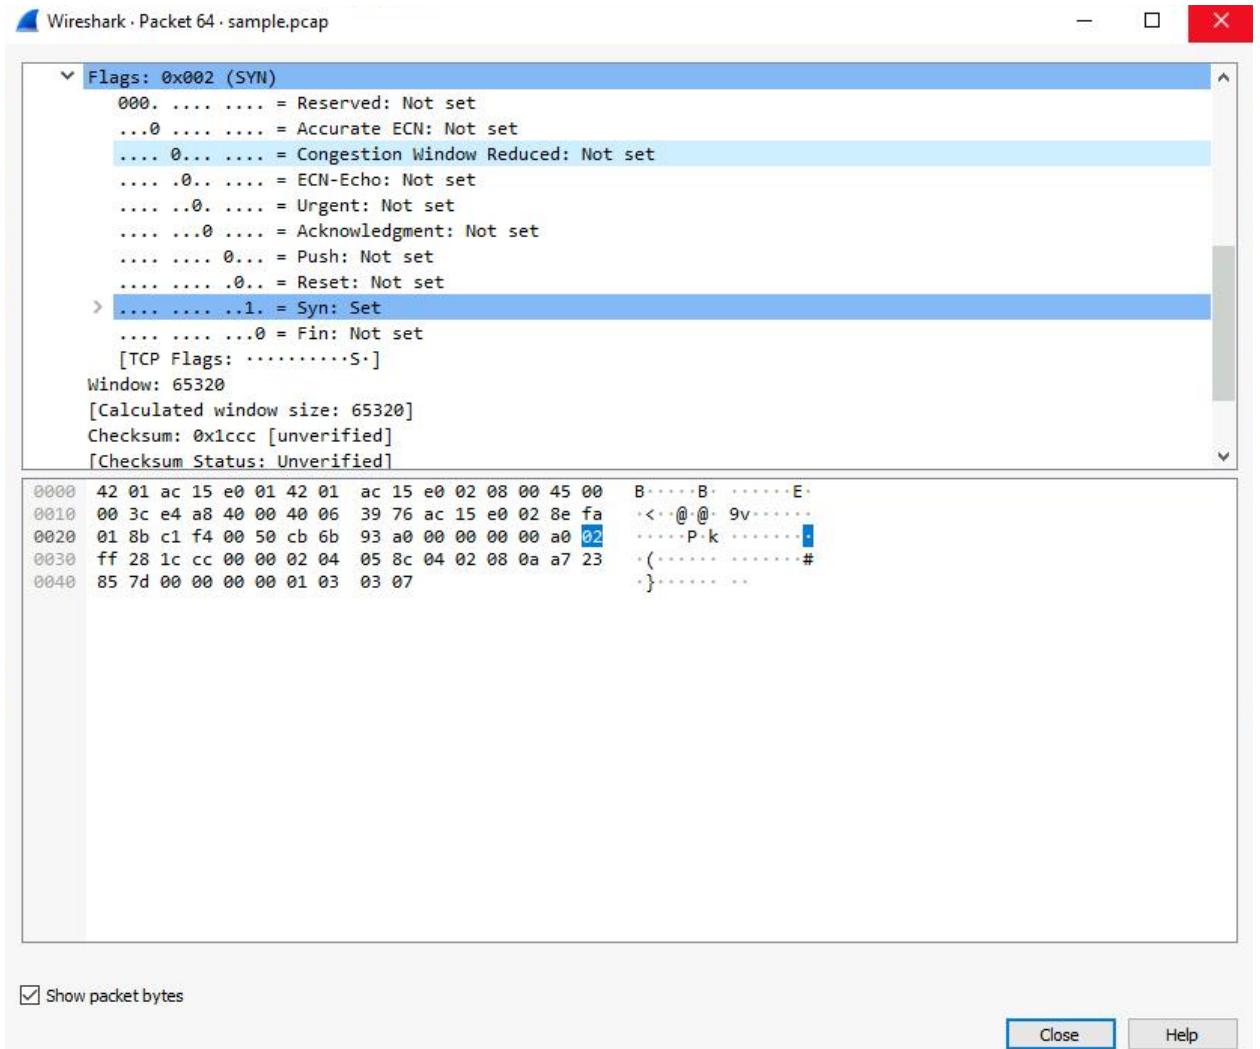

Port 80 is the TCP destination port for this packet. It contains the initial web request to an HTTP website that will typically be listening on TCP port 80.

8. In the **Transmission Control Protocol** subtree, scroll down and double-click **Flags**.

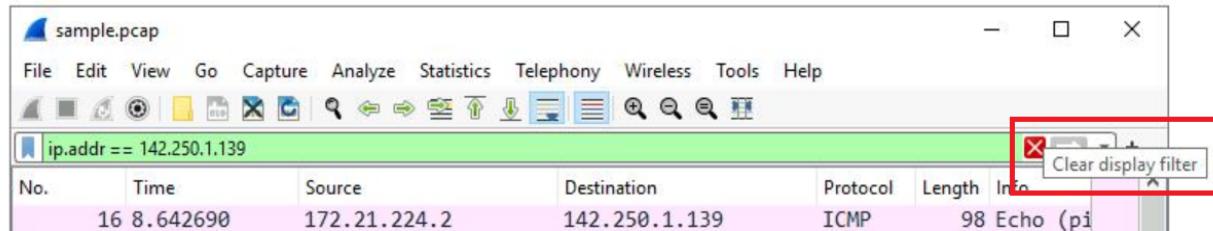

This provides a detailed view of the TCP flags set in this packet.

9. Click the **X** icon to close the detailed packet inspection window.

10. Click the **X Clear display filter** icon in the Wireshark filter bar to clear the IP address filter.

All the packets have returned to the display.

If you ever accidentally close the Wireshark application, you can reopen it by double-clicking the **sample** file on the desktop.

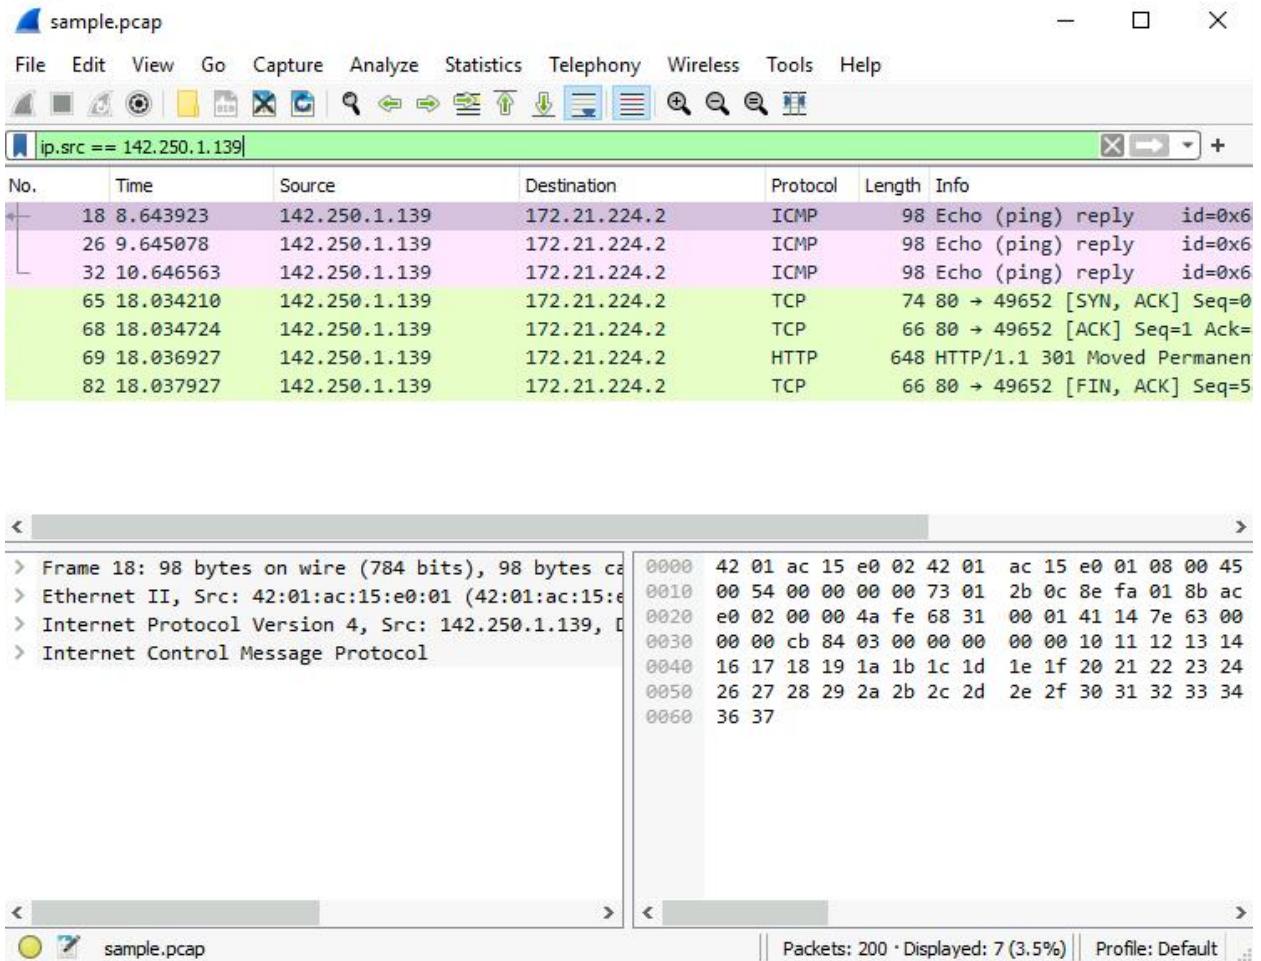

## Task 3. Use filters to select packets

In this task, you'll use filters to analyze specific network packets based on where the packets came from or where they were sent to. You'll explore how to select packets using either their physical Ethernet Media Access Control (MAC) address or their Internet Protocol (IP) address.

1. Enter the following filter to select traffic for a specific source IP address only.  
Enter this into the **Apply a display filter...** text box immediately above the list of packets:

```
ip.src == 142.250.1.139
```

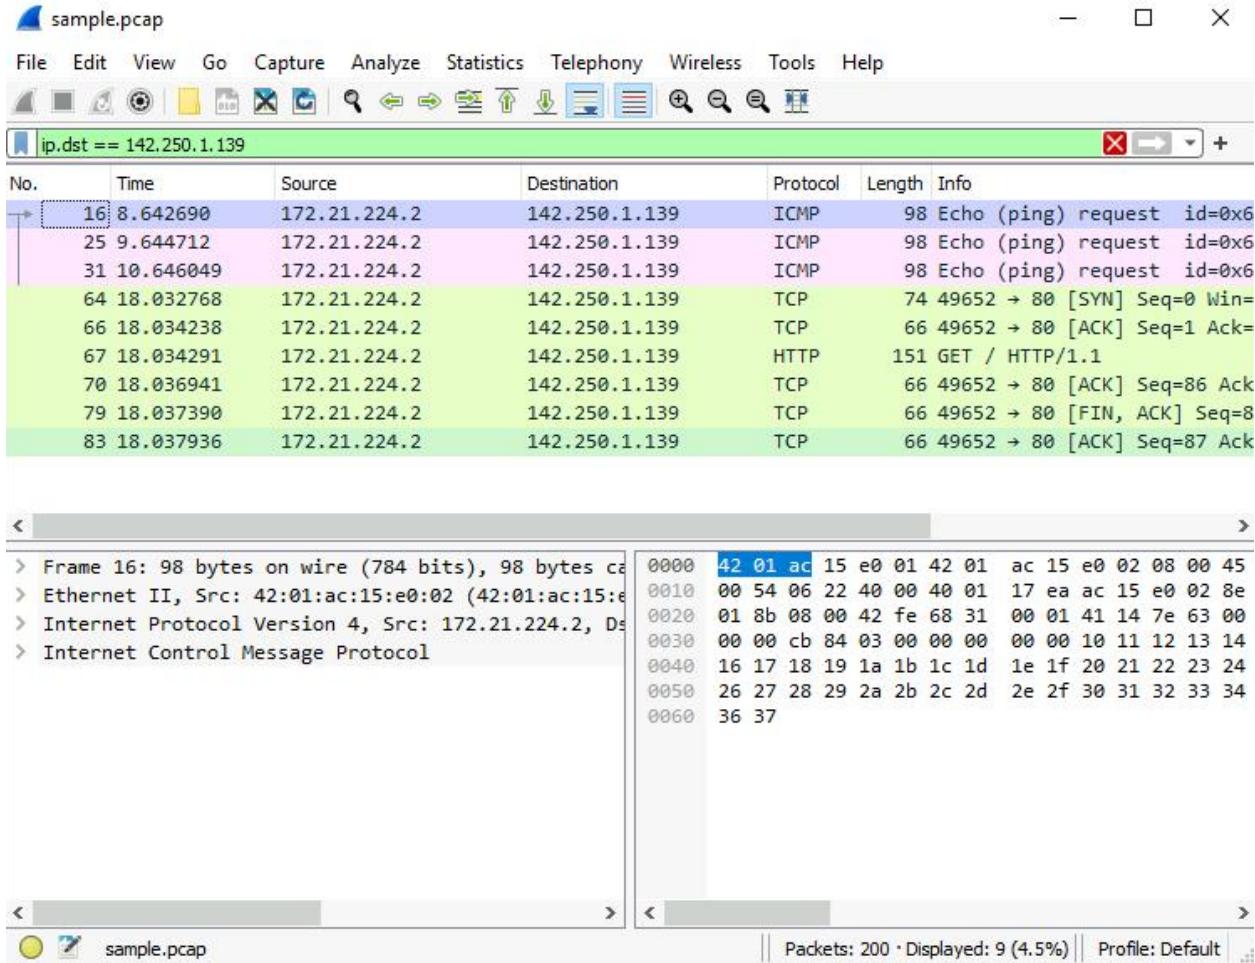

2. Press **ENTER** or click the **Apply display filter** icon in the filter text box.

A filtered list is returned with fewer entries than before. It contains only packets that came from 142.250.1.139.

3. Click the **X Clear display filter** icon in the Wireshark filter bar to clear the IP address filter.
4. Enter the following filter to select traffic for a specific destination IP address only:

```
ip.dst == 142.250.1.139
```

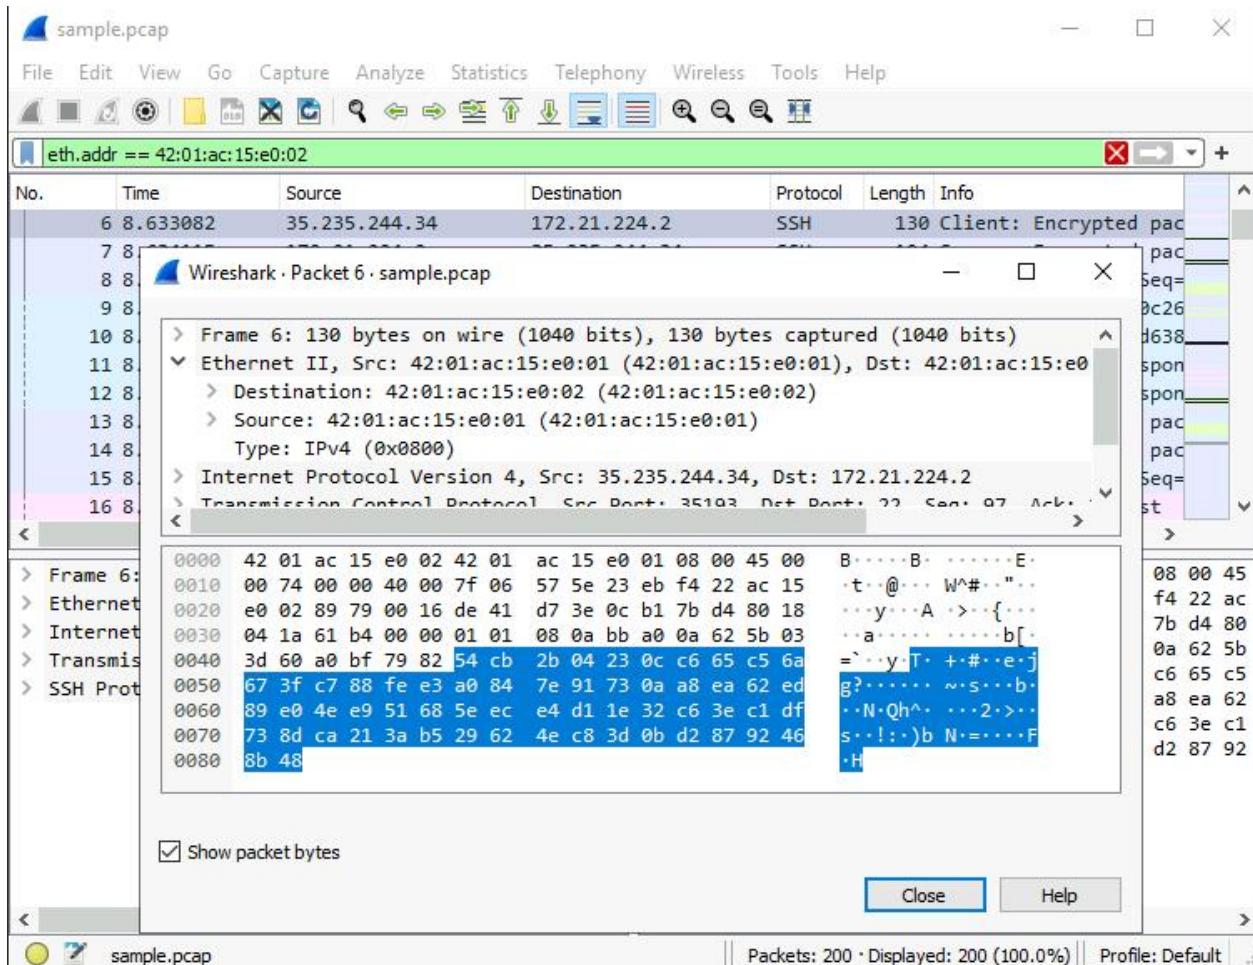

5. Press **ENTER** or click the **Apply display filter** icon in the filter text box.

A filtered list is returned that contains only packets that were sent to 142.250.1.139.

6. Click the **X Clear display filter** icon in the Wireshark filter bar to clear the IP address filter.
7. Enter the following filter to select traffic to or from a specific Ethernet MAC address. This filters traffic related to one MAC address, regardless of the other protocols involved:

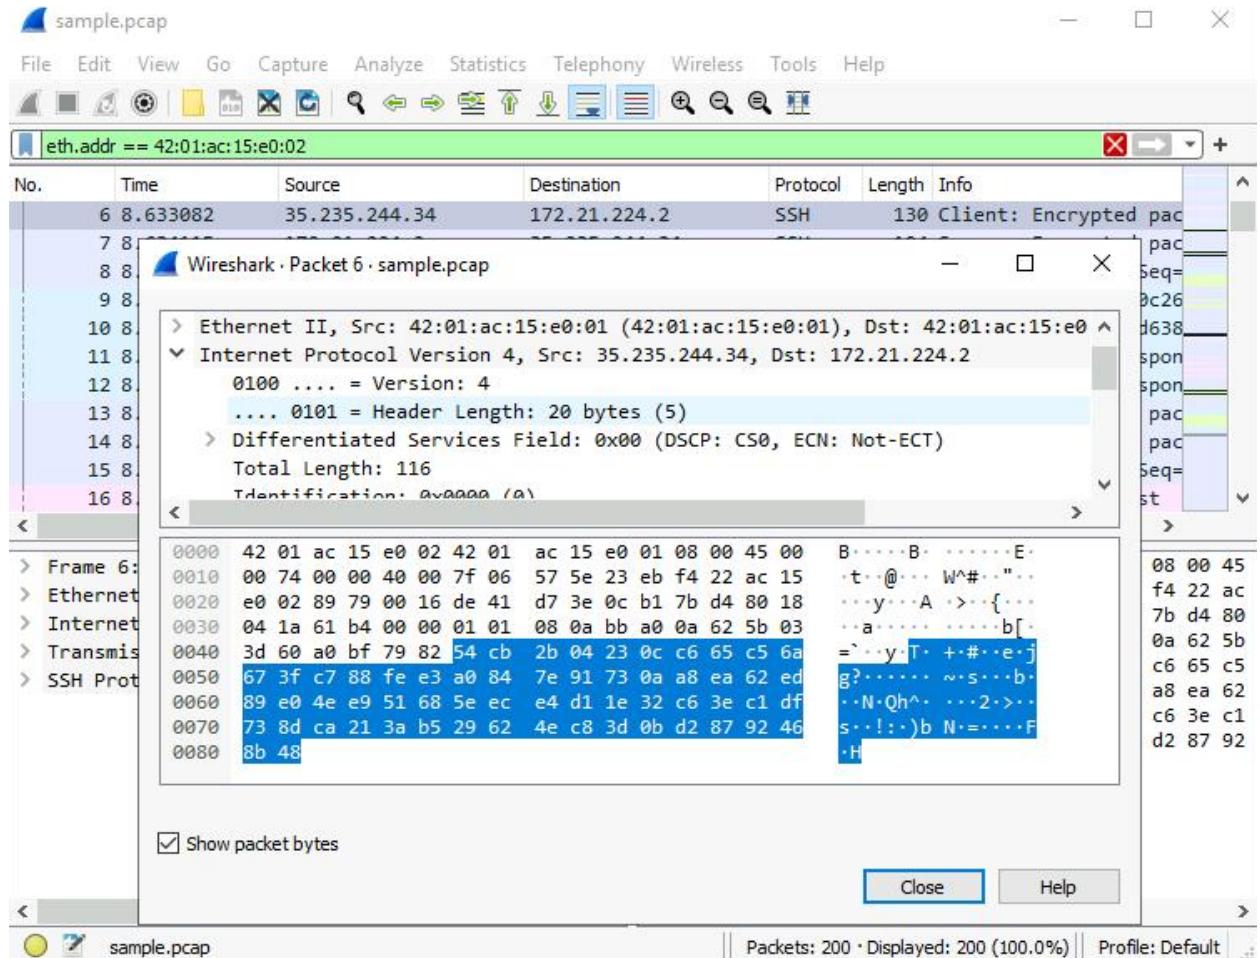

```
eth.addr == 42:01:ac:15:e0:02
```

8. Press **ENTER** or click the **Apply display filter** icon in the filter text box.
9. Double-click the first packet in the list. You may need to scroll back to display the first packet in the filtered list.
10. Double-click the **Ethernet II** subtree if it is not already open.

The MAC address you specified in the filter is listed as either the source or destination address in the expanded Ethernet II subtree.

11. Double-click the **Ethernet II** subtree to close it.
12. Double-click the **Internet Protocol Version 4** subtree to expand it and scroll down until the **Time to Live** and **Protocol** fields appear.

The **Protocol** field in the **Internet Protocol Version 4** subtree indicates which IP internal protocol is contained in the packet.

TCP is the internal protocol contained in the first packet from MAC address 42:01:ac:15:e0:02.

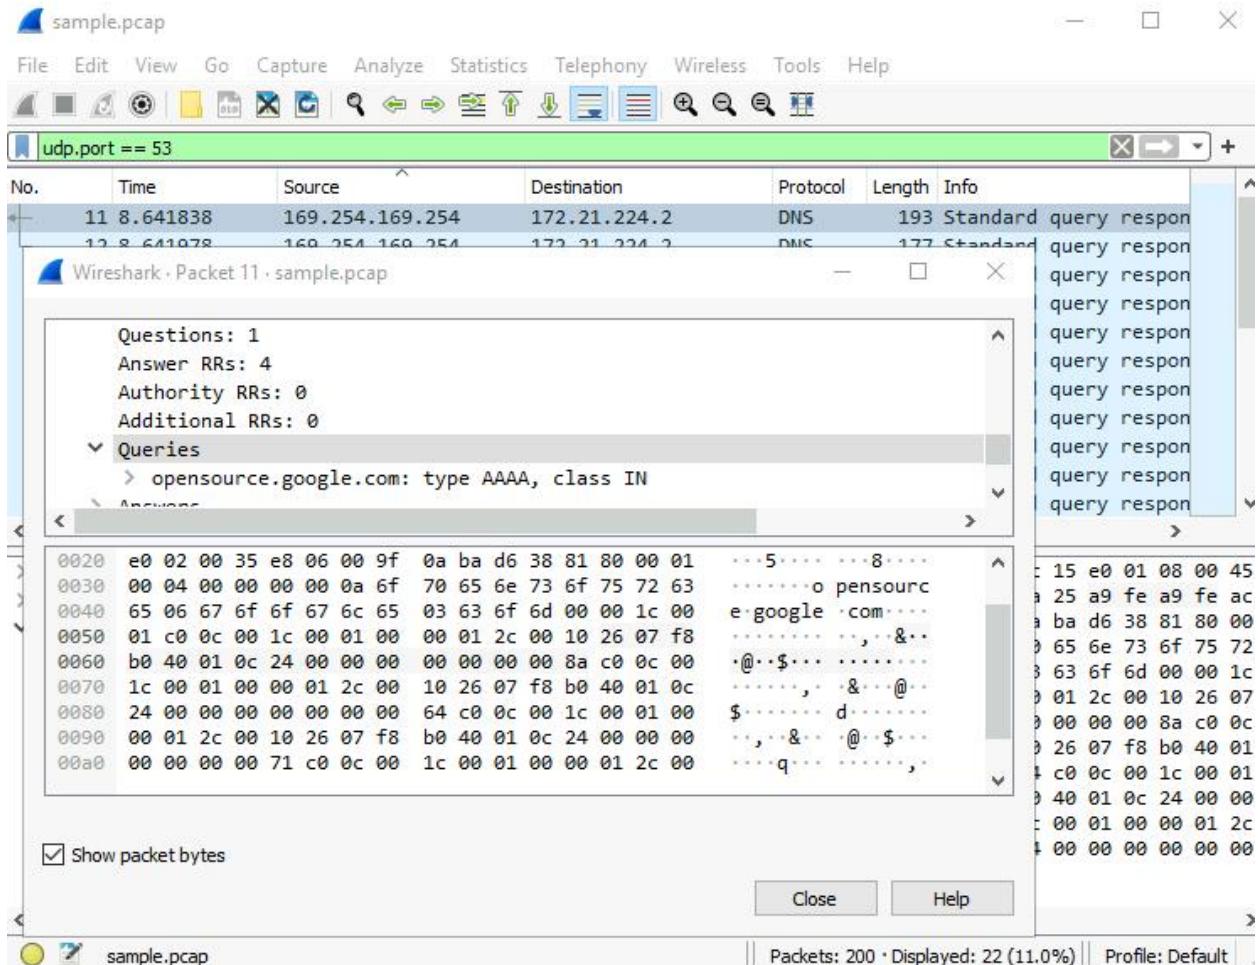

12. Click the X icon to close the detailed packet inspection window.
13. Click the **X Clear display filter** icon in the Wireshark filter bar to clear the MAC address filter.

## Task 4. Use filters to explore DNS packets

In this task, you'll use filters to select and examine DNS traffic. Once you've selected sample DNS traffic, you'll drill down into the protocol to examine how the DNS packet data contains both queries (names of internet sites that are being looked up) and answers (IP addresses that are being sent back by a DNS server when a name is successfully resolved).

1. Enter the following filter to select UDP port 53 traffic. DNS traffic uses UDP port 53, so this will list traffic related to DNS queries and responses only. Enter this into the **Apply a display filter...** text box immediately above the list of packets:

```
udp.port == 53
```

2. Press **ENTER** or click the **Apply display filter** icon in the filter text box.
3. Double-click the first packet in the list to open the detailed packet window.
4. Scroll down and double-click the **Domain Name System (query)** subtree to expand it.
5. Scroll down and double-click **Queries**.

You'll notice that the name of the website that was queried is **opensource.google.com**.

6. Click the **X** icon to close the detailed packet inspection window.
7. Double-click the fourth packet in the list to open the detailed packet window.
8. Scroll down and double-click the **Domain Name System (query)** subtree to expand it.

9. Scroll down and double-click **Answers**, which is in the **Domain Name System (query)** subtree.

The Answers data includes the name that was queried (**opensource.google.com**) and the addresses that are associated with that name.

The IP address 142.250.1.139 is displayed in the expanded Answers section for the DNS query for **opensource.google.com**.

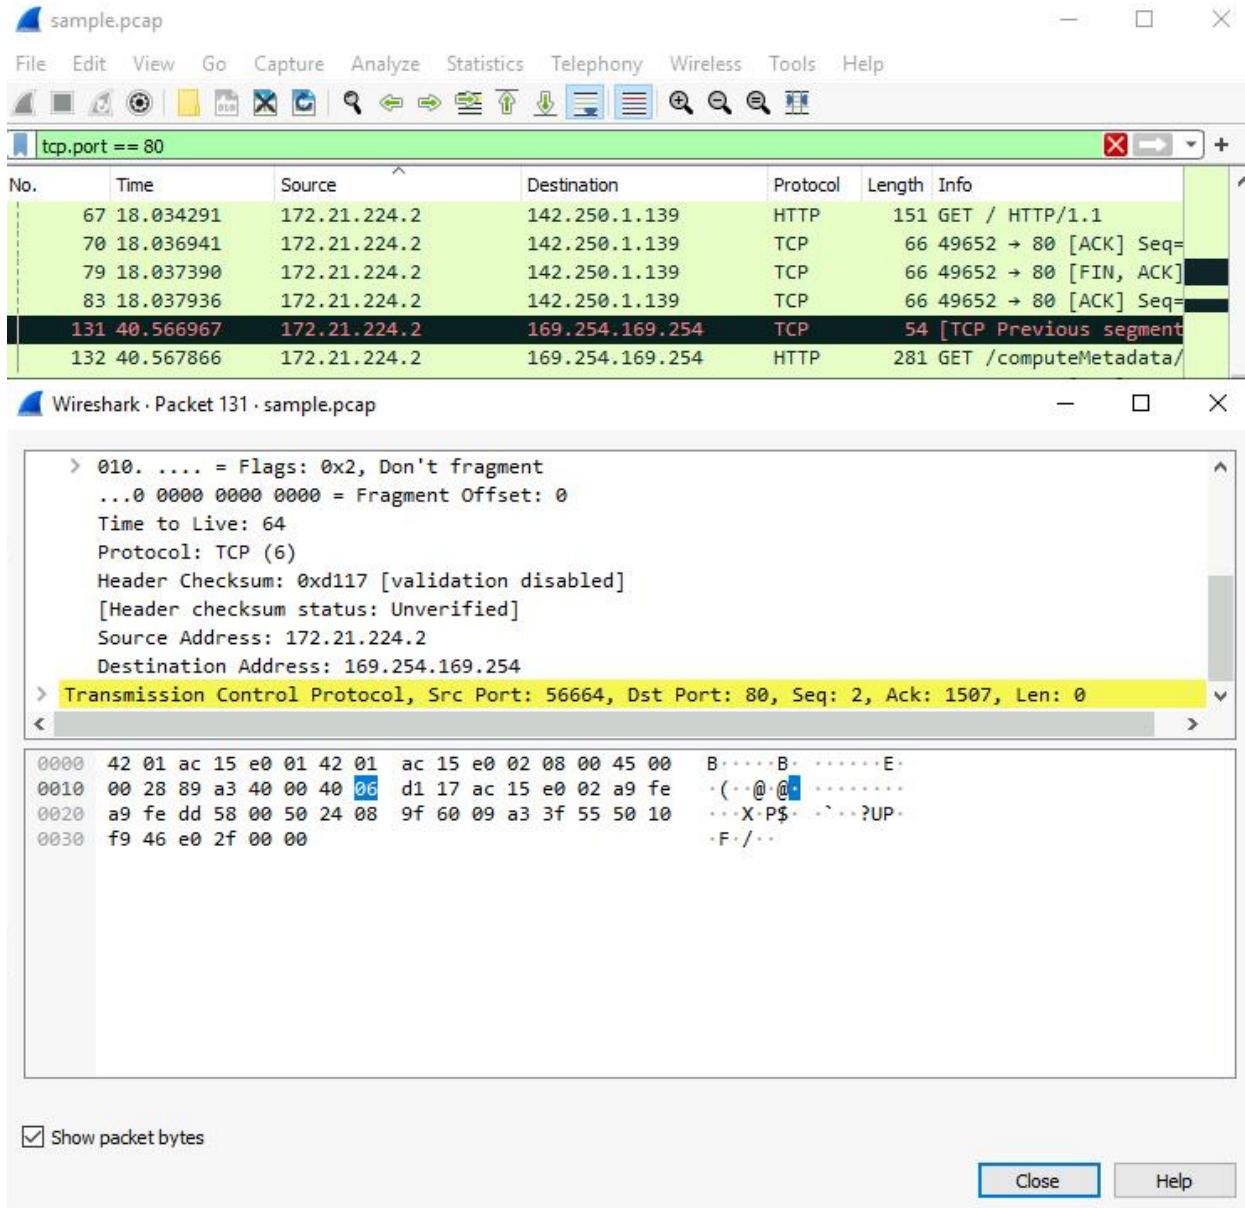

10. Click the **X** icon to close the detailed packet inspection window.
11. Click the **X Clear display filter** icon in the Wireshark filter bar to clear the filter.

## Task 5. Use filters to explore TCP packets

In this task, you'll use additional filters to select and examine TCP packets. You'll learn how to search for text that is present in payload data contained inside network packets. This will locate packets based on something such as a name or some other text that is of interest to you.

1. Enter the following filter to select TCP port 80 traffic. TCP port 80 is the default port that is associated with web traffic:

```
tcp.port == 80
```

2. Press **ENTER** or click the **Apply display filter** icon in the filter text box.

Quite a few packets were created when the user accessed the web page

<http://opensource.google.com>.

3. Double-click the first packet in the list. The **Destination** IP address of this packet is 169.254.169.254.

The Time to Live value is 64. This property is contained in the Internet Protocol Version 4 subtree, which is the third subtree listed in the detailed packet inspection window.

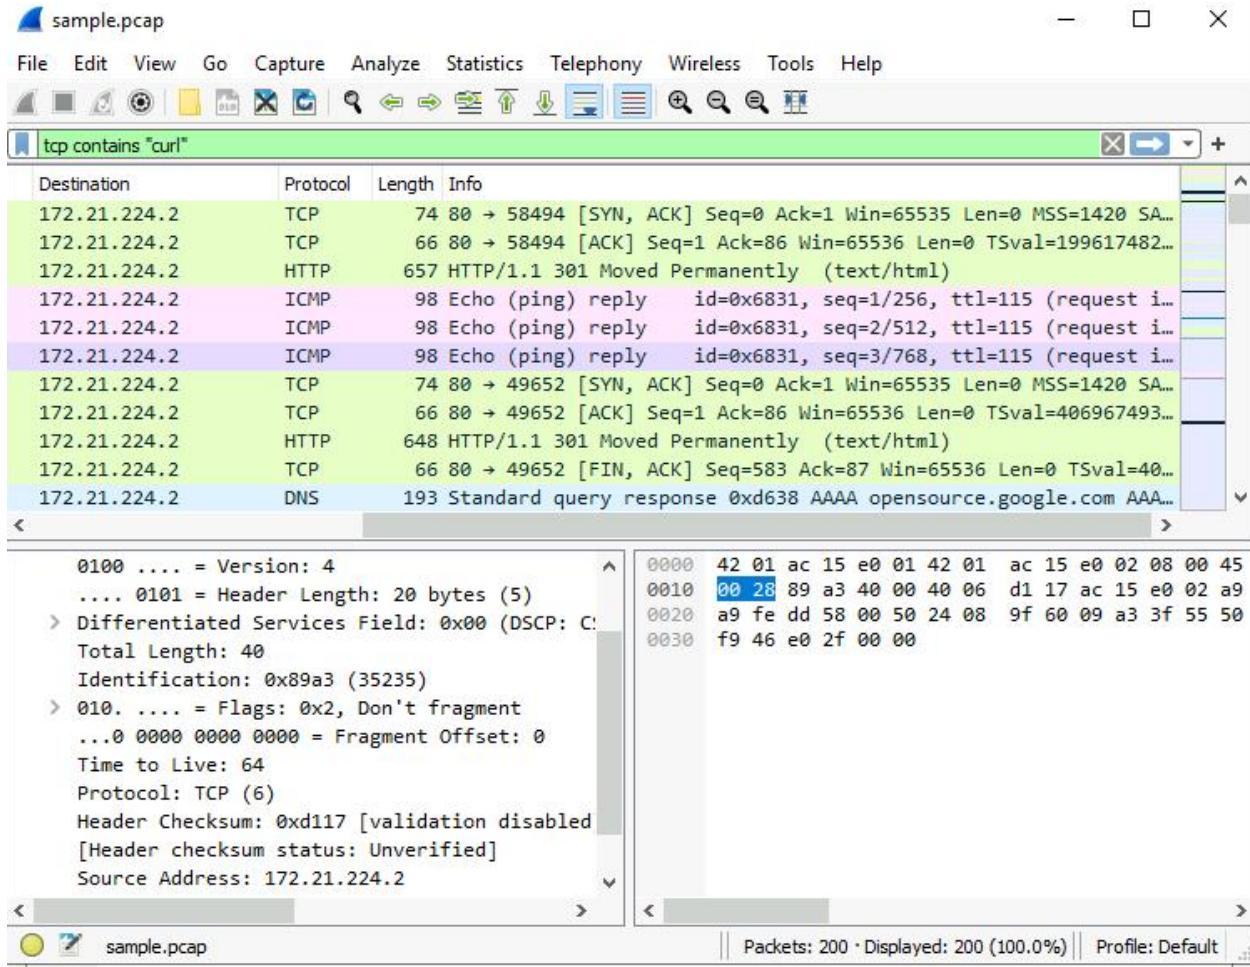

The Frame Length is 54 bytes. This property is contained in the Frame subtree, which is the first subtree listed in the detailed packet inspection window

The Header Length is 20 bytes. This property is defined in the Internet Protocol Version 4 subtree, which is the fourth subtree listed in the detailed packet inspection window.

The Destination Address is 169.254.169.254. This property is defined in the Internet Protocol Version 4 subtree, which is the third subtree listed in the detailed packet inspection window.

4. Click the **X** icon to close the detailed packet inspection window.
5. Click the **X Clear display filter** icon in the Wireshark filter bar to clear the filter.
6. Enter the following filter to select TCP packet data that contains specific text data.

```
tcp contains "curl"
```

7. Press **ENTER** or click the **Apply display filter** icon in the filter text box.

This filters to packets containing web requests made with the curl command in this sample packet capture file.
